1 b, because in RA-GRS data stored in multiple availability zones in primary and secondary region and allows read from both primary and secondary.

2 a, because it includes architectural guidance, design reviews, and advisory support.

3 b, because Saas don't provide full control over the deployment, for this we have to choose Paas.

4 a, because it provides managed environments for application development without managing infrastructure.

5 a, because load balancing only possible in standard plan.

6 b, because multiple AD requires increase management, resources cannot be easily shared, better to use RBAC or resource groups.

7 a, because of two instances we will need load balancing which is only possible in standard plan.

8 a, Azure's pay-as-you-go model aligns with the Operational Expenditure (OPEX) model, which is based on ongoing costs rather than large upfront investments.

9 b, Azure Cosmos DB is a globally distributed NoSQL database service designed for high availability, scalability, and low-latency data storage, but it does not provide tools for building, testing, or deploying predictive analytics. Better to use Azure ML.

10 a, Users can continue using their existing credentials, seamless authentication.

11 b, because it is not designed for resource automation, we can use infrastructure as code like terraform or ARM template.

12 b, Azure Reserved Virtual Machines (VM) Instances are best for long-term, consistent workloads because they require a commitment of 1 or 3 years to get cost savings.

13 c, it allows user to access VM remotely from their device w/o need of a on-premises VPN connection.

14 b, Azure Multi-Factor Authentication (MFA) is used for securing user sign-ins by requiring an additional authentication method (e.g., OTP, phone call, or biometric). However, we can use Azure key vault.

15 A united states government contractor, a united states government entity.

16 b, Azure AD Privileged Identity Management (PIM) is used to manage and control access to privileged roles in Azure AD, however we can use Azure AD Identity Protection.

17 b

18 No, yes, no

19 Yes, no, yes

20 d, because all things are provided by the provider, the only thing user have to do is configure the app as per the business need.

21 a, Fault tolerance ensures that the system remains available even if a failure occurs.

22 a, because the entire infrastructure is hosted in a cloud provider's data center

23 d, e

24 b, when migrating a public website to Azure, you must account for the ongoing costs associated with Azure services.

25 a, both are Paas solution

26 b, VM is a Iaas solution

27 c, allows to scale up and down with demand

28 b, PaaS allows you to focus on the web application without managing the underlying infrastructure

29 a, b

30 d, A hybrid cloud solution combines on-premises infrastructure with public cloud resources, providing scalability while minimizing capital and operational costs.

31 No. A hybrid cloud can be achieved by combining on-premises infrastructure

Yes. A company can leverage public cloud resources to scale its internal network capacity.

No. Public cloud resources are accessible to anyone with the appropriate permissions.

32 d, A public cloud is a cloud computing model where resources (such as servers, storage, and networking) are owned and managed by a cloud provider and shared among multiple customers.

33 b

34 c, in public cloud all resources are provided and managed by provider and shared among all users.

35 b, Azure Virtual Desktop is a desktop and application virtualization service that enables the use of a cloud-hosted version of Windows from any location.

36 a, you only pay for what you use

37 fault tolerance, disaster recovery, dynamic scalability, low latency

38 No, yes, no

39 No, yes, yes

40 Replacing failed server hardware, Managing physical server security

41 No, yes, yes

42 b

43 a, because the infrastructure is owned and managed by a third-party cloud provider

44 Provides a choice to use on-premises or cloud-based resources.

Provides complete control over security.

No required capital expenditure.

45 No, yes, no

46 a, A hybrid cloud is a combination of on-premises infrastructure (private cloud) and cloud-based resources (public cloud) that are connected and work together.

47 No, yes, yes

48 No, because Azure VM comes under Iaas

49 c, IaaS provides full control over the operating system, middleware, and runtime, allowing you to install and configure prerequisite applications as needed.

50 No, yes, yes
